

Food Batch Tracker

Thanks for your order. The first setup takes about half an hour, most of it typing your recipes. After that, it is one line for each batch.

Opening the file

Google Sheets: at drive.google.com, click *New > File upload*, pick **Food-Batch-Tracker.xlsx**, open it and choose *File > Save as Google Sheets*. **Excel:** double-click the file.

Setting it up

1. **Settings:** your business name and address, Best before or Use by, the last line of each label, and the allergen names used where you sell.
2. **Ingredients:** unit, pack size, pack price, and an x under each allergen. Packaging gets an x under Not on label.
3. **Products:** how many items one batch makes, how many days it keeps, and the price.
4. **Recipes:** what goes into one batch. Grams where you can, so the label lists the ingredients in order.
5. Delete the example bakery on every tab: it is made up. Select the yellow cells and press Delete, rather than deleting whole rows.

Each time you bake or cook

- **Batches:** the day and how many you made; the code and the date fill in. Later, what was sold, given away and thrown out.
- **Label:** pick the batch in the yellow box and print six labels to a page.
- **Purchases:** what you buy, with the lot number and the date on the pack; an x once it is finished.

Good to know

- **The labels only put together what you type.** Check them against the food rules where you sell.
- A label shows a warning in place of the list when there are more than 20 ingredients or the list is too long.
- Not on Ingredients in red on Recipes: that ingredient's cost and allergens are left out until you add it.
- Room for 40 products, 100 ingredients, 400 recipe lines, 500 batches and 400 purchases.
